cladogram is a hypothesis about
the evolutionary relationships
between the organisms depicted
on the tree. In this way, a
cladogram illustrates the lines of
descent for these organisms. A
cladogram proposes an answer to
the question "Which groups of
organisms share a common
ancestry?"

distantly related species in the cladogram. Functions as a point of comparison.

~~Unit 1 2: Cladistics — The Biology Classroom~~

cladogram, in this sense, is its length—the number of character state changes on the tree. Count the number of tick marks: the first and second trees have eight character state changes, including two cases of convergence. The third tree, however, has only seven changes, including only one case of convergence. We say it's the shortest tree. A cladist

Chimpanzees and humans share 96% of their DNA which would place them closely on a cladogram. Humans and fruit flies are placed farther apart on a cladogram since they share only approximately 60% of their DNA. In the space provided, draw a cladogram that shows the evolutionary relationship between humans, chimpanzees, and fruit flies. According to the cladogram, the chimpanzees are more closely related to humans compared to the fruit flies because they share more characteristics with them ...

~~Cladogram Assignment Answers~~
Students are given a description and an example of a cladogram showing the relationship between lizards, snakes, crocodiles, and birds. They are then walked through the process of creating a cladogram for five animal examples: frog, fish, bird, koala, and lizard. The process involves suggesting traits that these animals share and finding traits that are unique to determine outgroups.
